SALES PERFORMANCE & BUSINESS INSIGHTS REPORT

Executive Business Analytics Report

Prepared for	Executive Management
Analysis Period	Calendar year 2025 (daily data, as shown on the dashboard)
Prepared by	Abdul Aziz
Date	24 October 2026

Source: Sales Analytics Dashboard provided for analysis.

1. Executive Summary

> **HEADLINE**
> Sales of **204,090** are spread across four regions, but two categories bring in **70%** of them. Electronics is the engine of the business. The priorities are to protect it, lift North and West, and add margin data so we can tell which sales actually make money.

Business situation. East leads with 62,520 (30.6% of sales) and North trails with 43,350 (21.2%). Electronics contributes 40.55% of sales and Furniture 29.47%; Sports, Clothing and Food share the remaining 30%. Daily sales swing widely, and the anomaly check flags 12 unusually high days.

What matters most.

- Two categories carry the business, so a problem in either would hit most of our sales.
- An Electronics sale is worth far more than an average sale: the Key Influencers visual puts the difference at +936.7.
- North and West sit 15.0% and 10.2% below the regional average. Closing that gap is worth 12,885, or 6.3% of total sales (an arithmetic measure, not a forecast).
- The dashboard shows sales only. Without cost or margin we cannot say which sales are profitable.

What we recommend. Diagnose North and West against East; adopt an Electronics plan that adds margin visibility before any promotion; review the 12 flagged days; pilot growth in Sports and Furniture and cross-selling to Corporate customers; and extend the data model with margin, units, targets and prior-period figures.

Expected direction. A more balanced and more predictable sales base, tracked through regional share, category concentration and anomaly counts. We do not forecast a financial uplift because the dashboard holds no cost or prior-period data.

2. Business Context & Analytical Objective

The dashboard was built in Power BI from a daily sales file covering Region, Category, Product, Customer Segment and Sales for 2025. This report turns what the dashboard shows into decisions for management. It is built around one question: **where is sales performance strong or weak, what appears to drive it, and what should management do?**

To keep fact and opinion apart, the text separates what the dashboard shows, what we calculated from it, what we confirmed against the underlying Excel file (“source-data check”), and what is only a hypothesis. Sales are in the dashboard’s own units, as the currency is not stated, and the product “Table” is assumed to be Furniture.

3. Dashboard Overview & Data Check

The dashboard has a region slicer and total-sales card, sales by region and by category, a daily trend with anomaly markers, a Smart Narrative, a decomposition tree (Product, then Customer Segment) and a Key Influencers visual. We checked every reference figure against it. All match within rounding: total 204,090, East 62,520, North 43,350, Electronics 82,750, Furniture 60,140, Sports 32,390, Clothing 21,240, and Food 7,570 (3.71%, derived because the pie does not label it).

DATA QUALITY NOTES

1. Segment values cover Tablet only. The five segment figures (Corporate 6,170 up to Consumer 1,020) add up to 18,890, which is the Tablet total, not total sales of 204,090. We therefore use them as Tablet-level evidence only.

2. Rounding and the source file. Chart labels are rounded; exact South (52,410) and West (45,810) come from the source file. That file also holds a "Total Sales" row that must be excluded, or totals double to 408,180. The tree shows only the first five products, and the data ends on 16 December 2025.

4. Key Business Findings

Finding	Evidence	Why it matters	Priority
East leads, North trails	East 62,520 (30.6%) vs North 43,350 (21.2%); East is 44.2% higher	Uneven performance; 12,885 of headroom to the regional average	**High**
Two categories carry the business	Electronics 40.55% + Furniture 29.47% = 70.0%	A problem in either would hit most sales	**High**
Electronics sales are worth more	Key Influencers: Electronics +936.7, Phone +888.2	What we sell matters as much as how often	**High**
Daily sales swing widely	12 upward anomalies; the 12 highest days are all Electronics (source-data check)	Hard to plan around; spikes need explaining	**High**
Clothing and Food add little	10.41% and 3.71% of sales, yet 40% of all sales entries (source-data check)	Their role is unclear: traffic builder or drag?	**Medium**
Tablet skews to business buyers	Corporate 32.7% of Tablet sales, Consumer 5.4%	Concentration, and an untapped consumer segment	**Medium**

5. Regional Sales Analysis

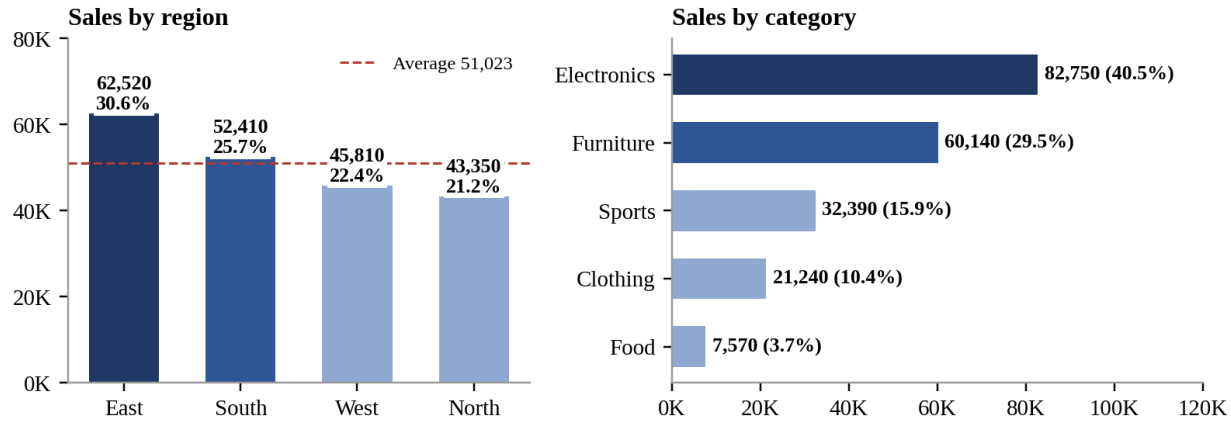

Figure 1: *Sales by region and by category (source: Sales Analytics Dashboard; South and West exact values from the source file)*

Region	Sales	Share	Rank	What it means
East	62,520	30.63%	1	Anchor region, 22.5% above the regional average (51,022.5)
South	52,410	25.68%	2	Solid second, 2.7% above average
West	45,810	22.45%	3	10.2% below average; Electronics is only 24.6% of its sales
North	43,350	21.24%	4	15.0% below average; fewest sales entries (76 vs 89 to 95)

East beats North by 19,170, and East and South together hold 56.3% of sales. A 10% fall in East alone would remove 6,252, or 3.1% of total sales. East's lead is tied to its mix: Electronics makes up 54.0% of East's sales against 40.6% overall (source-data check). North's gap looks activity-led rather than price-led, since its average value per entry is above South and West, but that needs validating. Management should find out why West under-sells Electronics, why North has fewer sales entries, and which of East's practices can travel.

6. Category Sales Analysis

Category	Sales	Share	Rank	What it means
Electronics	82,750	40.55%	1	Revenue engine with the highest value per sale
Furniture	60,140	29.47%	2	Strong second pillar
Sports	32,390	15.87%	3	Most entries (82) but low value each
Clothing	21,240	10.41%	4	Low contribution; influencer effect −342.9
Food	7,570	3.71%	5	Smallest; influencer effect −597.8

Electronics sells 10.9 times as much as Food, and the top three categories supply 85.9% of sales. Clothing and Food together bring in 14.1% of sales from 40% of sales entries (source-data check). High contribution is not the same as high growth potential. The dashboard has no category data over time, so it cannot show which category is growing. The biggest category is not automatically the best place to invest, and that call needs trend data.

7. Product Performance Analysis

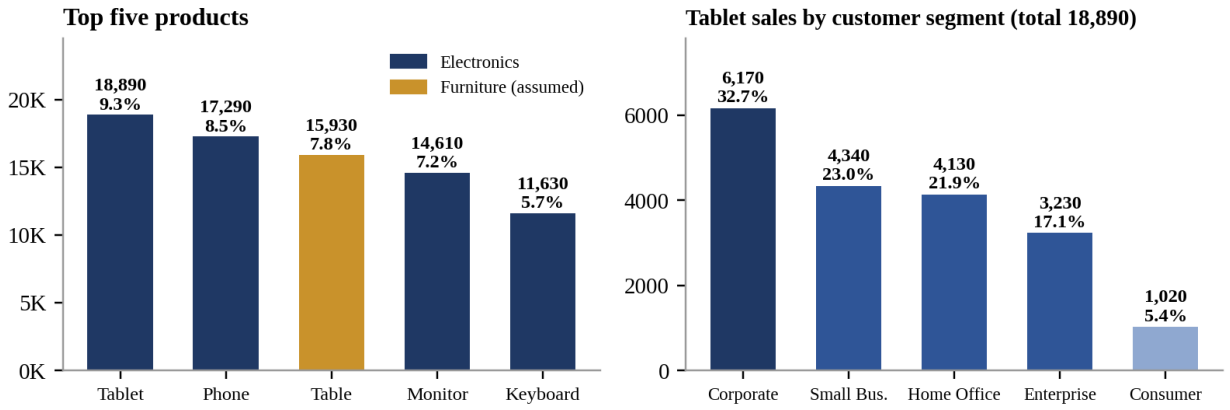

Figure 2: *Top five products (left) and Tablet sales by customer segment (right); source: decomposition tree*

Tablet (18,890), Phone (17,290), Table (15,930), Monitor (14,610) and Keyboard (11,630) together make up 38.4% of sales. Tablet and Phone alone bring in 17.7%, and four of the five are Electronics. Table anchors Furniture at 26.5% of that category (source-data check). Key Influencers point to Tea and Sweater as low-value products, and each of the six Food products is under 1% of sales. Products outside the top five are not visible, and with no margin data we cannot judge profitability.

8. Customer Segment Analysis

Read with Note 1: these figures describe Tablet only. Corporate buys six times as much Tablet as Consumer (6,170 vs 1,020), and the three business segments together account for 77.5% of Tablet sales. Across all products, however, segments are evenly spread, from 18.5% (Corporate) to 21.1% (Small Business) of total sales (source-data check). Consumer is 20.8% of total sales but only 5.4% of Tablet, so Tablet is under-sold to consumers. Corporate is the smallest segment

overall, and 56.7% of its sales are Electronics against only 15.8% Furniture, which suggests room to cross-sell. The dashboard holds no retention, acquisition-cost or lifetime-value data, so we draw no conclusions on those.

9. Daily Sales Trend & Anomaly Analysis

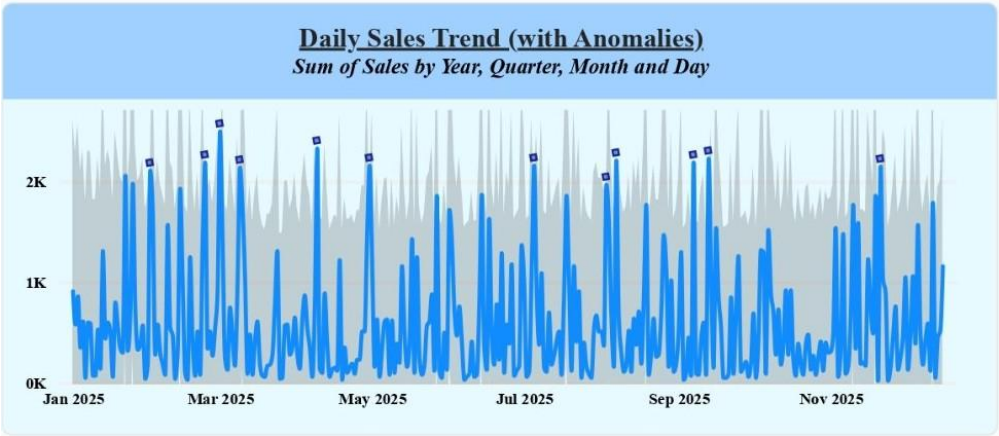

Figure 3: *Daily Sales Trend panel (source: Sales Analytics Dashboard)*

Daily sales swing between near zero and about 2.5K with no lasting upward or downward trend, and the shaded expected range is wide. The 12 markers all sit on upward peaks, spread across the year, and none is flagged on the downside. The source file shows daily sales vary almost as much as their own average (coefficient of variation about 0.96). The 12 highest days (2,060 to 2,500) are all Electronics, and five are Corporate entries, although Corporate is only 17.7% of entries. This suggests the swings are largely a product-mix effect. Promotions, large corporate orders, seasonality, launches and data-entry errors are all possible explanations, but they are hypotheses. Management should review each flagged date rather than treat the markers as errors.

10. Key Influencers Analysis

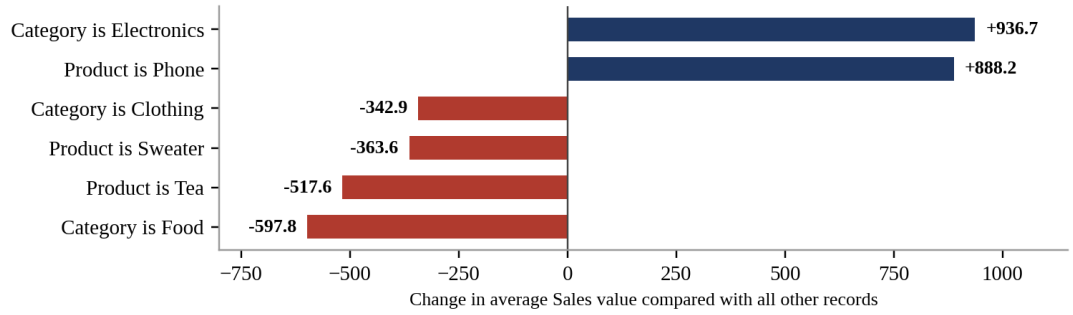

Figure 4: *Key Influencers: effect on average Sales value (Increase and Decrease views)*

Each figure is the gap between the average sale with that attribute and the average of all other records. Electronics averages 1,356.6 against 419.9 elsewhere, a difference of +936.7, which we confirmed in the source file. This is an association, not proof of cause: Electronics may sell for more because of price, customer type or bundles, none of which the dashboard shows. The influencers also overlap, since Phone sits inside Electronics and Tea inside Food. For management the lesson is that mix drives results. Electronics produces 40.55% of sales from only 17.4% of entries, so its drivers deserve study before pricing or promotions change.

11. Business Problems & Root-Cause Analysis

Each problem below is paired with its evidence and a likely driver. “Supported” means the source-data check backs the driver; “Hypothesis” means it still needs validation.

Problem	Evidence	Likely driver	To validate
Regional gap	East +22.5% vs average; North −15.0%; West −10.2%	**Supported:** East is Electronics-heavy (54.0% of sales); West is Furniture-led; North has the fewest entries. **Hypothesis:** coverage, customer mix, pricing	Region × category × segment × month data
Reliance on two categories	70.0% of sales	**Supported:** high value per Electronics sale (1,356.6 vs 419.9). **Hypothesis:** price points, bundles, corporate buying	Units, prices, discounts, margin
Low-value tail	Food −597.8; Clothing −342.9; 14.1% of sales	**Supported:** low value per sale (106.6 and 307.8). **Hypothesis:** they may build traffic or baskets	Margin and basket data
Volatile daily sales	12 spikes; variation about 0.96	**Supported:** top 12 days all Electronics. **Hypothesis:** promotions, large orders, seasonality, data entry	Orders behind flagged dates
Tablet skewed to Corporate	32.7% vs 5.4% Consumer	**Supported:** Consumer is 20.8% of total sales. **Hypothesis:** price, channel, marketing focus	Price, channel, marketing by segment
Sales-only view	No cost, margin, growth or targets	Scope of the dashboard	Add the missing data

The dashboard shows the symptoms and relationships, but transaction-level data is needed to confirm the underlying causes.

12. Business Opportunities

- **Regions:** lift North and West toward the average (gaps of 7,672.5 and 5,212.5) and reuse East’s practices once validated.
- **Categories and products:** protect Electronics, grow Sports and Furniture, and settle the role of Clothing and Food.
- **Customers:** test a consumer Tablet offer, and build Corporate bundles that go beyond Electronics.
- **Sales pattern:** find out what created the spikes, then plan around them.

13. Strategic Recommendations & Management Decisions

These are the five decisions we recommend management take now, in priority order.

Priority	Finding and recommendation	Expected benefit	KPI	When
High	**North and West are 15.0% and 10.2% below average.** Diagnose both against East (category, segment, coverage, pricing) and set gap-to-average targets.	Narrower regional gap; better-aimed investment	Regional share; gap to average	0 to 90 days
High	**Electronics is 40.55% of sales and lifts value per sale by 936.7.** Secure supply and pricing for Tablet, Phone and Monitor; add margin data before promotions.	Protected core revenue	Electronics sales, share, margin	0 to 90 days
High	**12 anomalies and high volatility.** Review each flagged date, record its cause and set planning ranges.	More reliable planning	Anomaly count; volatility	0 to 30 days
Medium	**Two categories supply 70.0% of sales.** Pilot growth in Sports and Furniture and Corporate cross-selling; define the role of Food and Clothing.	Less dependence	Top-two category share	3 to 6 months
Medium	**The dashboard shows sales only.** Add cost, margin, units, discounts, returns, targets and prior-period data, and an all-product segment view.	Profit-based decisions	Margin and growth reporting live	0 to 90 days

14. Executive Action Plan

Phase	Key actions	Owner (function)	Measure of success
0 to 30 days	Review the 12 flagged dates; label the segment view as Tablet-only and show exact values and the full product list; agree watch thresholds (East share 30.6%, top-two category share 70.0%)	Business Intelligence; Sales Management; Finance	Anomalies explained; data issues closed
31 to 90 days	North and West diagnostic; Electronics pricing, range and supply review; role review for Food and Clothing; Tablet segment pilots	Regional Sales; Category Management; Marketing; Finance	Regional share; Electronics share and margin
3 to 6 months	Diversification pilots; planning model with anomaly-based ranges; roll out validated East practices; add growth and target KPIs	Category Management; Regional Sales; BI; Operations	Top-two category share; volatility; regional growth

15. KPI Framework

KPI group	What to track (current reference)	How management should use it
Size and mix	Total sales (204,090); regional share (East 30.6%); category share (Electronics 40.55%); product and segment sales	Spot where sales come from and set targets by region and category
Growth	Sales growth (not yet available; needs prior-period data)	Separate today’s contribution from future potential
Stability	Daily volatility (about 0.96); anomaly count (12)	Set planning ranges and review every unusual day
Concentration	Top-two category share (70.0%); East and South share (56.3%)	Set a watch threshold and report it quarterly

16. Data Limitations & Further Analysis

The dashboard does not hold cost, profit, margin, acquisition cost, lifetime value, inventory, returns, discounts, marketing spend or transaction detail, so we make no profitability or ROI

claims. It also lacks prior-period and target data, shows segments for Tablet only, and lists just five products. The source file has 350 daily entries from 1 January to 16 December 2025, one per day, so December is partial and order count cannot be separated from order value. Key Influencers show association, not cause. The next analyses we need are region × category × segment × month, units and prices, margin by product, and detail behind the flagged dates.

17. Conclusion

The key message is that sales of 204,090 are concentrated: East and South hold 56.3%, and Electronics and Furniture hold 70.0%. Results depend on the value of each sale as much as on how many sales are made. Management should close the North and West gap, protect Electronics while build a more balanced portfolio, explain the daily spikes, and add margin and prior-period data. Concentration raises exposure, volatility raises planning risk, and without margin we cannot tell whether growth creates profit. Causes should be treated as confirmed only after transaction-level validation.
